

3.1 Android Notification Setup

Follow the steps below:

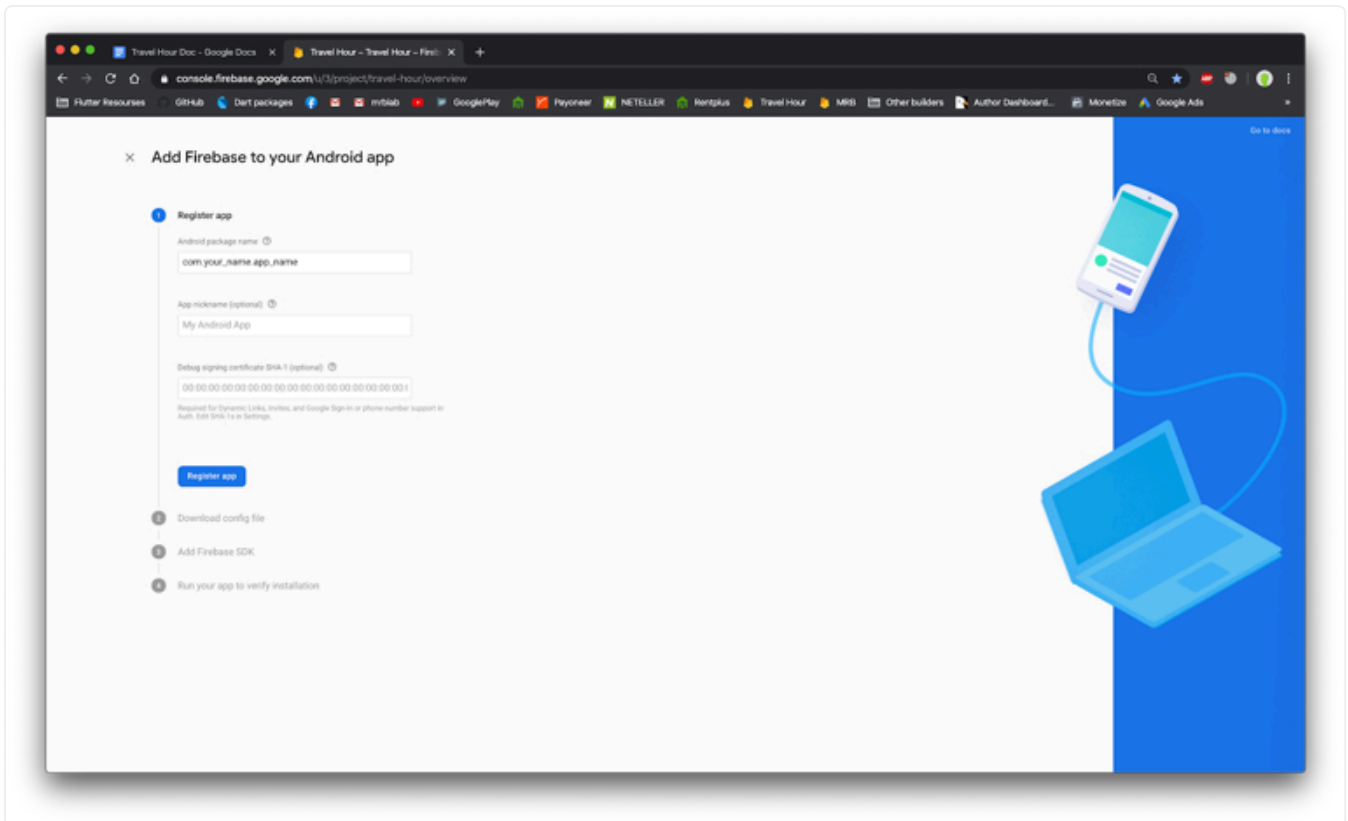

- From your firebase console, open the project you have just created.
- Go to the Project Overview and click on the **plus icon** and then click on the **Android icon**.

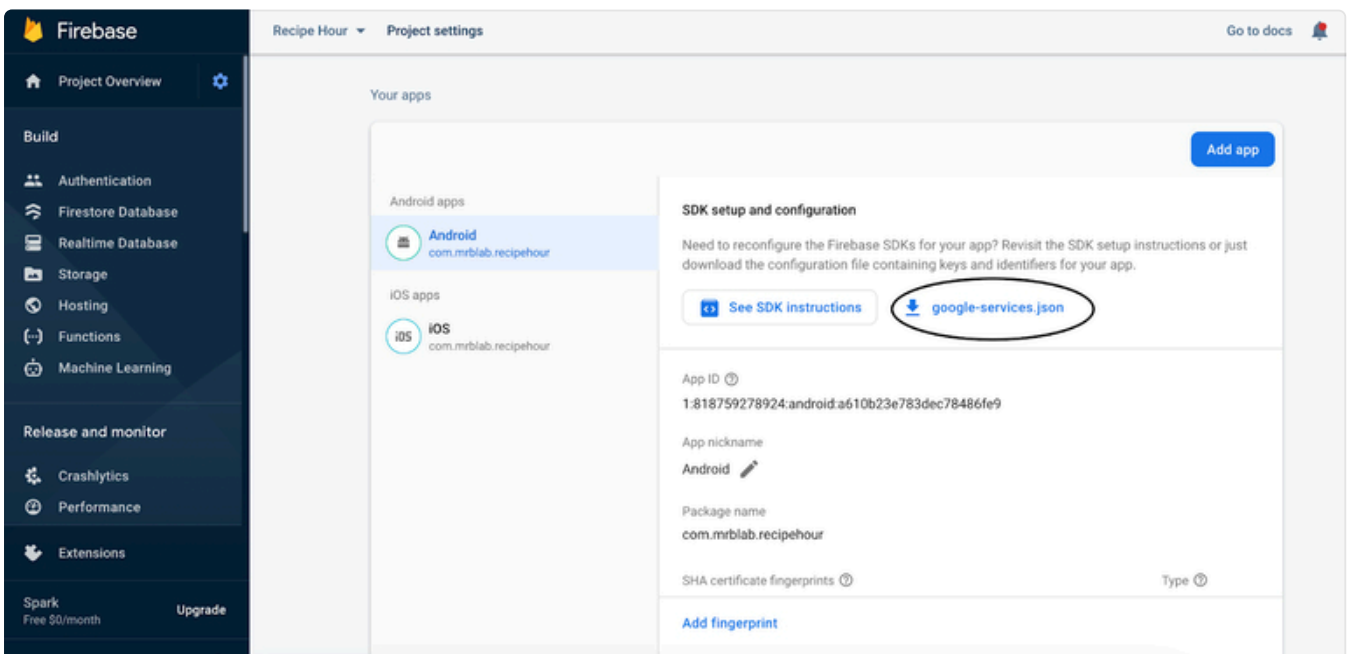

- Enter your android package name.

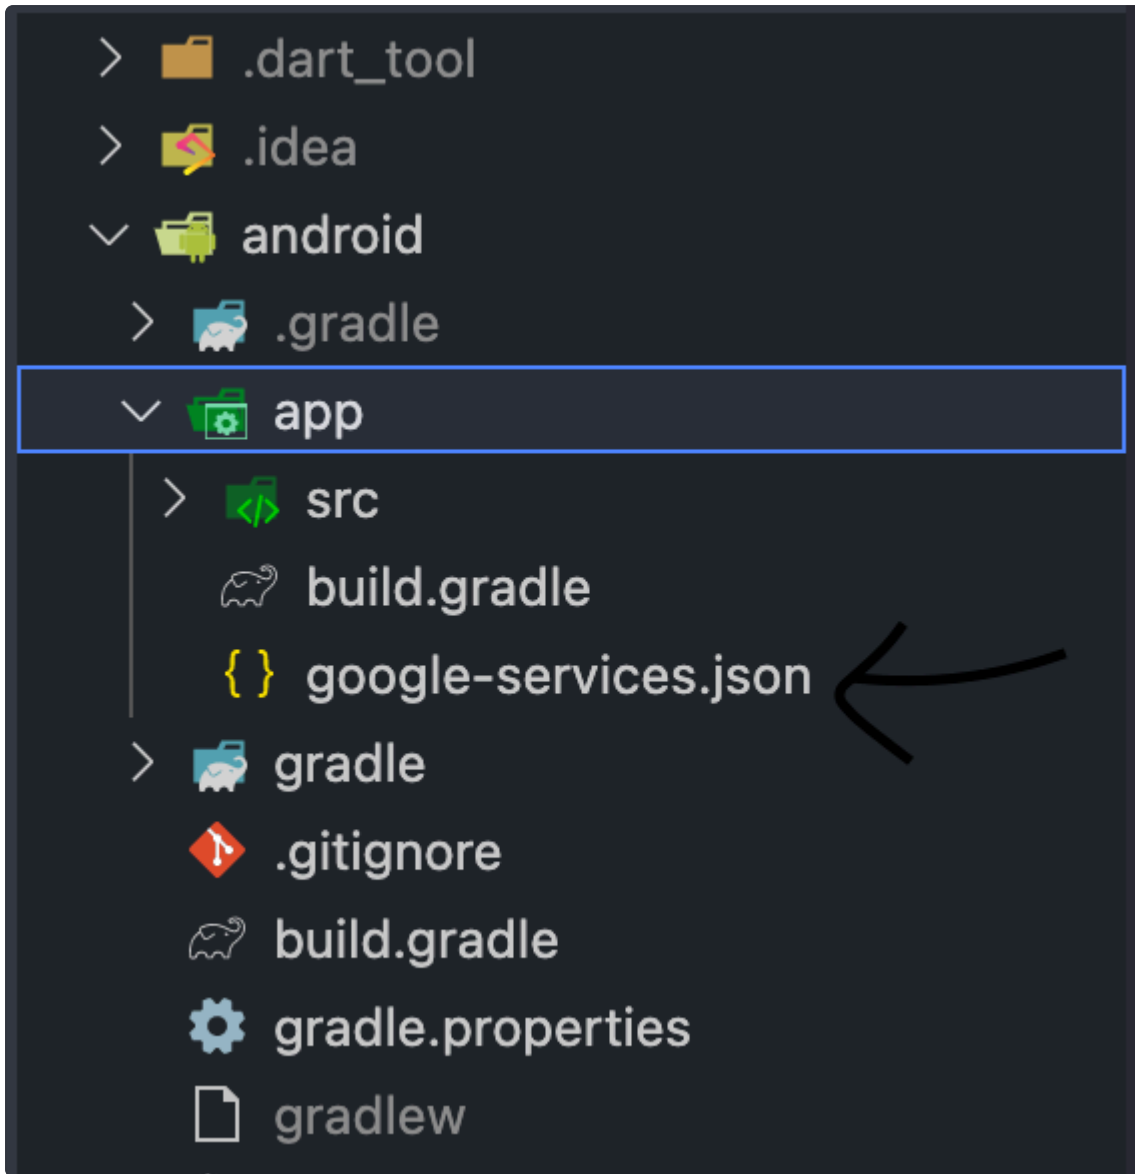

Your package name should be like `com.your_name.your_app_name` . Example:
com.microsoft.skype. You can use the same package name for android & iOS. iOS doesn't support under space in the package name. So, keep in mind that if you want to use the same package name for both android & iOS.

- Click on the register app and skip other steps by clicking next.
- Now go to **Project Settings** and click on the android icon and download **google-service.json** file.

- Now go to the **wordpress_app/android/app** directory and paste the **google-service.json** file here.
