

3.2 iOS Notification Setup

Follow the steps below:

- From your Firebase Console > Project Overview, click on the iOS icon and enter your iOS package name and click on the Register app and skip the other steps.

- Now go to **Project Settings** and click on iOS and download the **GoogleService-info.plist** file.
- Then go to the **wordpress_app/ios/Runner** directory and paste the file here.
- Now, Open the iOS folder on Xcode by right-clicking on the iOS folder from VSCode or Android Studio and go to the runner folder and drag & drop the **GoogleService-info.plist** file here. You will get a popup and click yes or confirm the popup message. That's it.

For iOS, Go to this [link](#) and follow the instructions. This is a well-written doc from Flutter Team. Please ignore the (Advanced, Optional) step from there.
