

6.2 Uploading At Google Play

At Google Play Store

Make sure that you have done all the things that are required for the android release.

To test the released android app, run the following command on the terminal:

```
flutter build apk --split-per-abi
```

You will get 3 apk files from the **build/app/output/apk/release** folder. You can test the **app-armeabi-v7a-release.apk** file on your android device.

If you want to publish the app in the google play store, don't upload any of the following apk files. Use an **appbundle** file which is recommended by Google

To generate an appbundle, run the following command on the terminal:

```
flutter build appbundle
```

After that, you will get a .aab file in the **build/app/output/appbundle/release** folder.

Now you can upload this .aab file to the google play store.
