

# SIMG – PHP Script Installation

---

## Requirements:

- Shared Hosting or VPS
- Apache Web Server
- PHP 5.4 & up version

## Installation:

“SIMG” is highly portable and all you need to do in order to install the script is to upload all the files inside the “simg-simple-image-hosting-php-script” folder into your website root folder (e.g. public\_html) or a sub-folder you wish your image hosting to be located. For this purposes you can use your favorite FTP client (or any other FTP client such us [FileZilla](#), [WinSCP](#) or [SmartFTP](#)).

## Script Configurations:

Using your FTP Client, connect to your website and edit the **simg-config.php** file.

The most important configurations are:

- **\$site\_url** – which is the address location of your website (and the sub-folder, if the script was uploaded into a sub-folder such as [www.site.com/imghost](#)). Do not enter the website protocol here (e.g. http or https).
- **\$site\_protocol** – is the protocol used image links which can be **http** or **https**.
- **\$contact\_email** - your email address visitors can contact you.
- **\$company\_name** – is your brand or company name.
- **\$site\_name** – is the name you use for your website or image hosting section of your website.
- **\$site\_title** – the title used in the browser website page title bar.

The other configurations are optional and are explained directly in the **simg-config.php** file.

To browser uploaded images visit the address [www.yoursite.com/simg-files.php](#)

(Username is: **admin** and the default password is: **admin123simg**)
